Focus on type 2 diabetes management with your patients

After conducting an initial medical evaluation:
1. Establish a physician-coordinated team that includes nurses, diabetes educators, dietitians, pharmacists, mental health professionals, and other specialists with expertise in diabetes
2. Encourage patients to take an active role in their care while working closely with family and healthcare team members
3. Develop, with the patient, a treatment plan that considers:
   - Habits and lifestyle
   - Cultural factors
   - School or work situation
   - Complications and/or other medical conditions
4. Set A1C and other lifestyle goals with the patient
5. Provide educational tools and support
6. Emphasize the importance of diabetes self-management
7. Encourage continuing lifestyle modifications, as appropriate, including:
   - Nutrition evaluation and therapy
   - Weight loss
   - Physical activity
8. Patient and physician can monitor overall glucose control, taking into consideration diet, exercise, and/or medications
9. Consider combination therapy to help improve glycemic control

Monitor blood glucose levels

- Teach patients how to conduct self-monitoring of blood glucose (SMBG)
- Routinely evaluate patient SMBG technique
- Perform periodic A1C measurements:
  - At least twice a year for patients who are at their glycemic goal
  - Quarterly for patients who have changed therapy or who are not at their glycemic goal

Glycemic goals
